Sandusky-Clyde Energy Solutions Permit Issued by Ohio EPA

Ohio EPA has issued an air pollution permit to Sandusky-Clyde Energy Solutions for construction of a new natural gas-fired electric power plant in Clyde.

The company plans to install seven natural gas-fired engines and electrical generators. The plant will be located at 1357 McPherson Highway (U.S. 20). Electricity would be produced for sale on the power grid.

The permit limits the facility's annual air emissions to 11.62 tons of carbon monoxide and 2.73 tons of nitrogen oxides. Emissions also would include up to 0.28 tons per year of volatile organic compounds. The maximum allowable emission levels in the permit are designed to meet federal air quality standards to protect human health and the environment.

The company has discussed using alternative fuels, including pyrolysis of solid waste, to produce energy. The permit issued by Ohio EPA only allows the company to use natural gas as a fuel source. Ohio EPA will address potential emissions from alternative fuels if the company moves forward with those plans.

Ohio EPA held a public hearing on the permit on September 28, 2010, in Clyde. A copy of the [final permit](#) and Ohio EPA response to public comments received during the public comment period and at the public meeting is available online.
