## Executive Summary

The *Ohio 2016 Integrated Water Quality Monitoring and Assessment Report* summarizes water quality conditions in the State of Ohio. The report satisfies Ohio's water quality reporting requirements under Sections 303(d), 305(b) and 314 of the Clean Water Act. The report was last updated in 2014. **Analysis and listing changes are based on data collected during 2013 and 2014 for all uses; recreation and public drinking water supplies uses also included data from 2015, therefore impairment listings may not reflect current conditions.**

Using methods devised to determine the suitability of waters for four specific uses—aquatic life (fish and aquatic insects), recreation (such as boating and swimming), human health (related to fish tissue contamination) and public drinking water supplies—available data were compared with water quality goals. The results indicate which waters are meeting goals and which are not. Waters not meeting the goals for one or more of the four types of uses are referred to as *impaired*. The waters found to be impaired are prioritized and scheduled for further study and restoration.

The report describes the methods used to judge impairment of each type of use and have evolved in each reporting cycle as the Agency gains access to more data and develops better ways to interpret them.

Results are reported for 1,538 watershed units, 38 large river units (in Ohio's 23 rivers that drain more than 500 square miles) and three Lake Erie shoreline units (including waters within 500 yards of public drinking water intakes). Additional information on streams draining between 20 and 500 square miles is presented as this subset of waterbodies is used to calculate and track progress of Ohio's 80 percent full attainment by 2020 goal for wading and principal streams and rivers.

Ohio's large rivers reflected a small decline in percent of monitored miles in full attainment compared to the same statistic reported in the 2014 IR. The "100% full attainment by 2020" aquatic life goal statistic for Ohio's largest rivers now stands at 87.4 percent, down 1.8 percent from the 2014 report. Conversely, smaller streams continue to improve with the average watershed score increasing from 64.2 percent to 66.1 percent of monitored sites in full aquatic life use attainment. The top reasons for aquatic life impairment continue to be sediment, nutrients, habitat modification, hydromodification and organic enrichment.

For the human health use (fish tissue), PCB contamination in fish is the cause of most of the human health impairments in Ohio. Mercury is the second leading cause.

The chemicals of concern causing impairment of the public drinking water supply use include nitrate, atrazine and cyanotoxin (due to certain algae). The primary source of the chemicals is nonpoint source runoff from agricultural land use. Additional sources of nitrate include home and commercial fertilizer application, failing septic systems, unsewered areas and wastewater treatment plant discharges. Of the 123 public drinking water supply assessment units, 19 are now listed as impaired by algae, with another 19 on the watch list for algae (more than double the 2014 report).

The recreation use analysis focuses on the number of bacteria in the water. For Lake Erie public beaches, the frequency of swimming advisories varies widely, ranging from 1.3 percent to over 60

percent. Generally, beaches located near population centers have the most problems. Results are also reported for streams and inland lakes.

Of the 6,316 possible category assignments, the 2016 303(d) list includes changes in 463, with 132 delistings and 331 new listings. Most 303(d) removals and new listings are due to new data.

## Changes since the 2014 Integrated Report

Changes made between the 2014 Integrated Report and the 2016 Integrated Report are as follows:

- The Harmful Algal Bloom (HAB) information has been moved from Section I to Section C7.
- The report contains a new section dedicated to Ohio’s 303(d)/TMDL Program Vision (Section C8).
- Information was added to the end of Section H regarding an error that was discovered in the 2014 list pertaining to improperly listed PDWS use waters.
- A description of “Near Term Priorities for Ohio EPA” has been added to Section J2.
- The report contains a new subsection discussing Ohio’s approach to addressing nutrients in Lake Erie (Section J3), and Lake Erie information has been added or moved to Sections C1 and D3.
- Section L5 (Monitoring and TMDL Schedules for Ohio’s Watershed and Large River Assessment Units) was removed from the report; consequently, previous Section “L6” was re-numbered/labeled.
