

## Evaluation of Background Metal Soil Concentrations

The Ohio EPA Division of Environmental Response and Revitalization, Site Investigation Field Unit (DERR-SIFU) is currently sampling surficial soils (*less than 4'*) in several Ohio counties to determine the county specific background metals concentrations. This information is being developed for use with Voluntary Action Program sites. The counties currently being sampled are marked below with diagonal lines. As the reports are completed, they will be added to the internet and the counties will become solid in color in order to clearly indicate the availability of the reports. As time permits, additional counties will be sampled and reports will be written and added to the internet.

*(Select a county from the map below for information on the county's soil report)*
