## Summary Biological Assessment of the North Fork Yellow Creek in the Vicinity of the Hammondsburg AMD Site

Ohio EPA collected fish and macroinvertebrate data from sites in the North Fork Yellow Creek and Yellow Creek during 2002 to assess the impact from an AMD source which enters the North Fork near the town of Hammondsburg at RM 0.23. Results are summarized in the attainment table (Table 1). Also attached are the Qualitative Habitat Evaluation Index (QHEI), Index of Biotic Integrity (IBI), and Invertebrate Community Index (ICI) summary tables (Tables 2-4) and site data for the fish and macroinvertebrate collections (Tables 5 and 6). Both the North Fork and Yellow Creek are designated Warmwater Habitat (WWH) in the Ohio Water Quality Standards.

Physical habitat conditions in the North Fork and Yellow Creek as measured by the QHEI were very good to exceptional and consequently indicated that a sufficient number of high-quality habitat attributes existed to support biological communities expected for the respective WWH aquatic life use designations. Scores ranged from 70.0 to 89.5. Attributes associated with WWH streams were prevalent at all sampling locations with only a few moderate influence negative attributes affecting the majority of the sites, specifically channel embeddedness due to sand and other fines from coal mining.

Fish collections at all sites in the North Fork and Yellow Creek reflected good quality, diverse communities; IBI and MIwb scores were near or exceeding the ecoregional biocriteria at all sites including downstream from the AMD seep near the mouth of the North Fork and in Yellow Creek downstream from the North Fork confluence. However, at these latter two sites, slight index departures occurred in the form of non-significant departures of the MIwb score (North Fork) and IBI score (Yellow Creek). These departures were considered relatively minor and reflected a negligible impact from the AMD source. The lower than expected IBI score for Yellow Creek downstream from the confluence with the North Fork was driven by the first-pass score and may be attributable to a combination of elevated stream flow and avoidance of the AMD discharge. Yellow Creek downstream from the North Fork was considerably more discolored from AMD discharge on the first pass (06/27/2002) than on the second pass (09/05/2002).

Macroinvertebrates followed a pattern similar to the fish with good to very good ICI scores and communities present at all sites except the site in the North Fork downstream from the AMD source. With the exception of this site, communities were well populated with macroinvertebrates including 45 to 56 total taxa and 13 to 17 taxa of pollution sensitive mayflies, caddisflies, and stoneflies. At the site downstream from the AMD source (RM 0.2), overall total taxa diversity was fairly similar to the immediate upstream site but overall organism density and taxa diversity of the more sensitive mayfly and caddisfly taxa were both noticeably reduced. This resulted in an ICI score (20) below ecoregional expectations and reflected a fair quality community. The observation of a pervasive precipitate silt cover throughout the stream reach below the AMD source was evidence of its impact on the stream bottom habitat and probably was the most important factor affecting the macroinvertebrate community.

Overall, full attainment of the WWH aquatic life use designation was documented in the North Fork upstream from the AMD site and in Yellow Creek upstream and downstream from the North Fork confluence. Partial attainment was documented in the short North Fork reach downstream from the AMD site due to the measured decline in the macroinvertebrate community.

Table 1. Attainment status of the designated Warmwater Habitat (WWH) aquatic life use for Yellow Creek and the North Fork Yellow Creek based on biological sampling conducted during 2002.

RIVER MILE	IBI	MIwb	ICI <sup>a</sup>	QHEI	Attainment Status	Site Location
