

Table 10. Mean and median relative cover of perennial native hydrophytes from random plots sampled at mitigation bank subareas. Number calculated by summing relative cover values of perennial native hydrophytes for each random plot and then calculating the average or median value for all random plots in that bank subarea. Sites with an asterisk (*) have importance values for wetland canopy trees in parenthesis since cover of canopy tree species not included in cover estimate. Values in boldface would be considered as meeting or on a trajectory to meeting performance goal of >75% cover of native perennial hydrophytes.
